

# ReInHerit WEBINAR

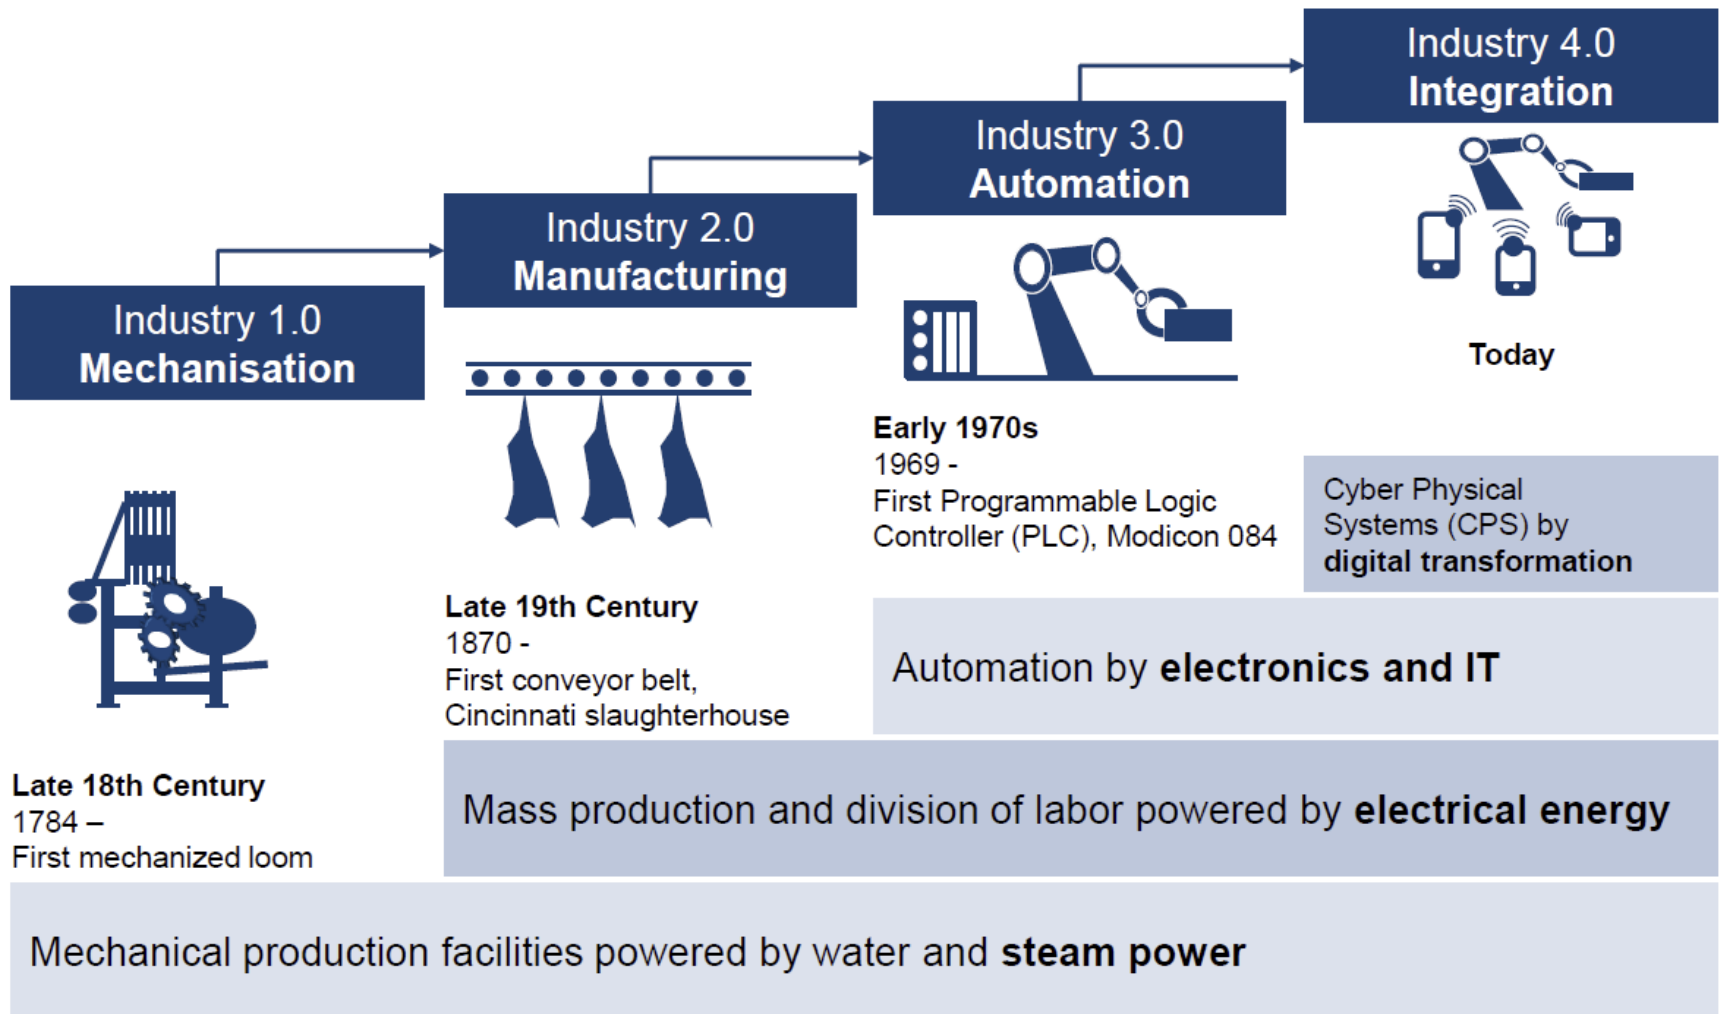

“The contribution of modern technologies to the protection of archaeological sites and monuments in an environment of intense climatic phenomena.”

**21 July 2023** | 3:00-4:00 pm (CET)

# Industrial 4.0

# Industrial 4.0

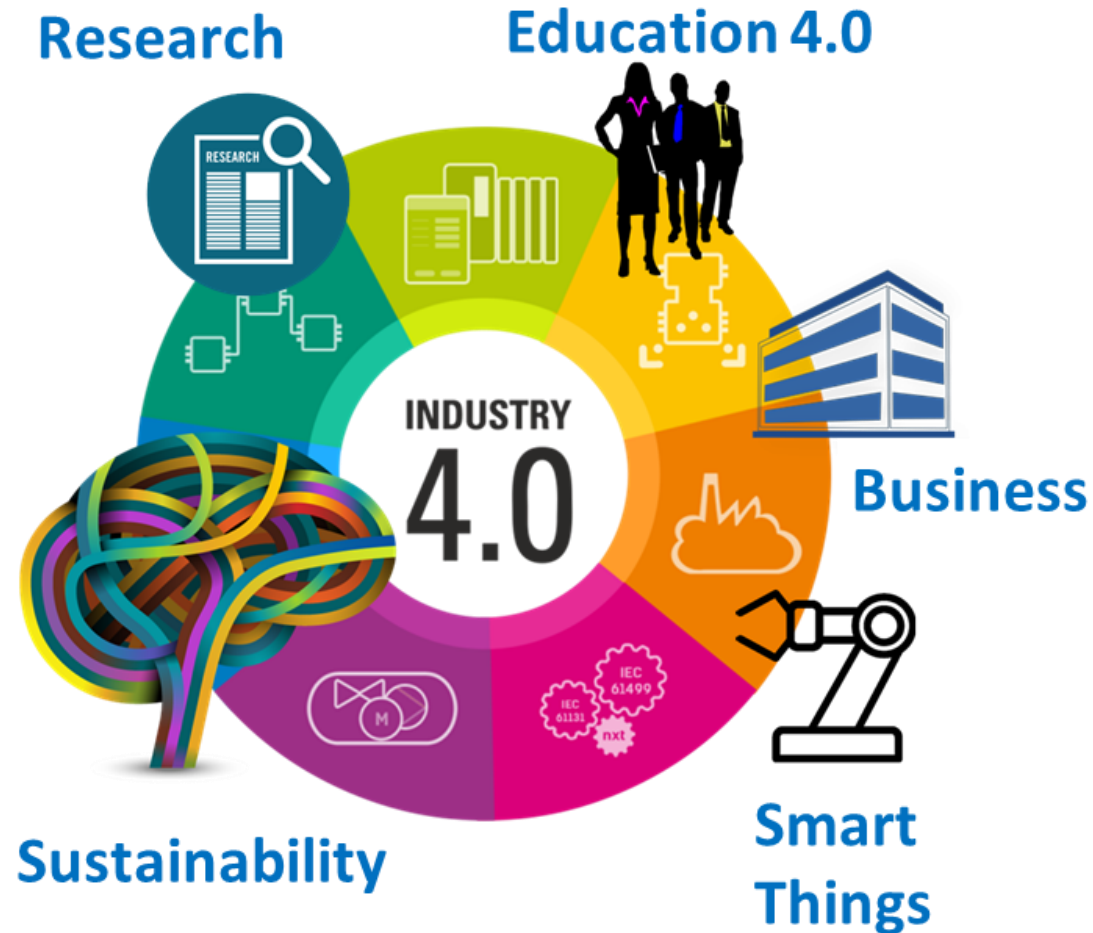

---

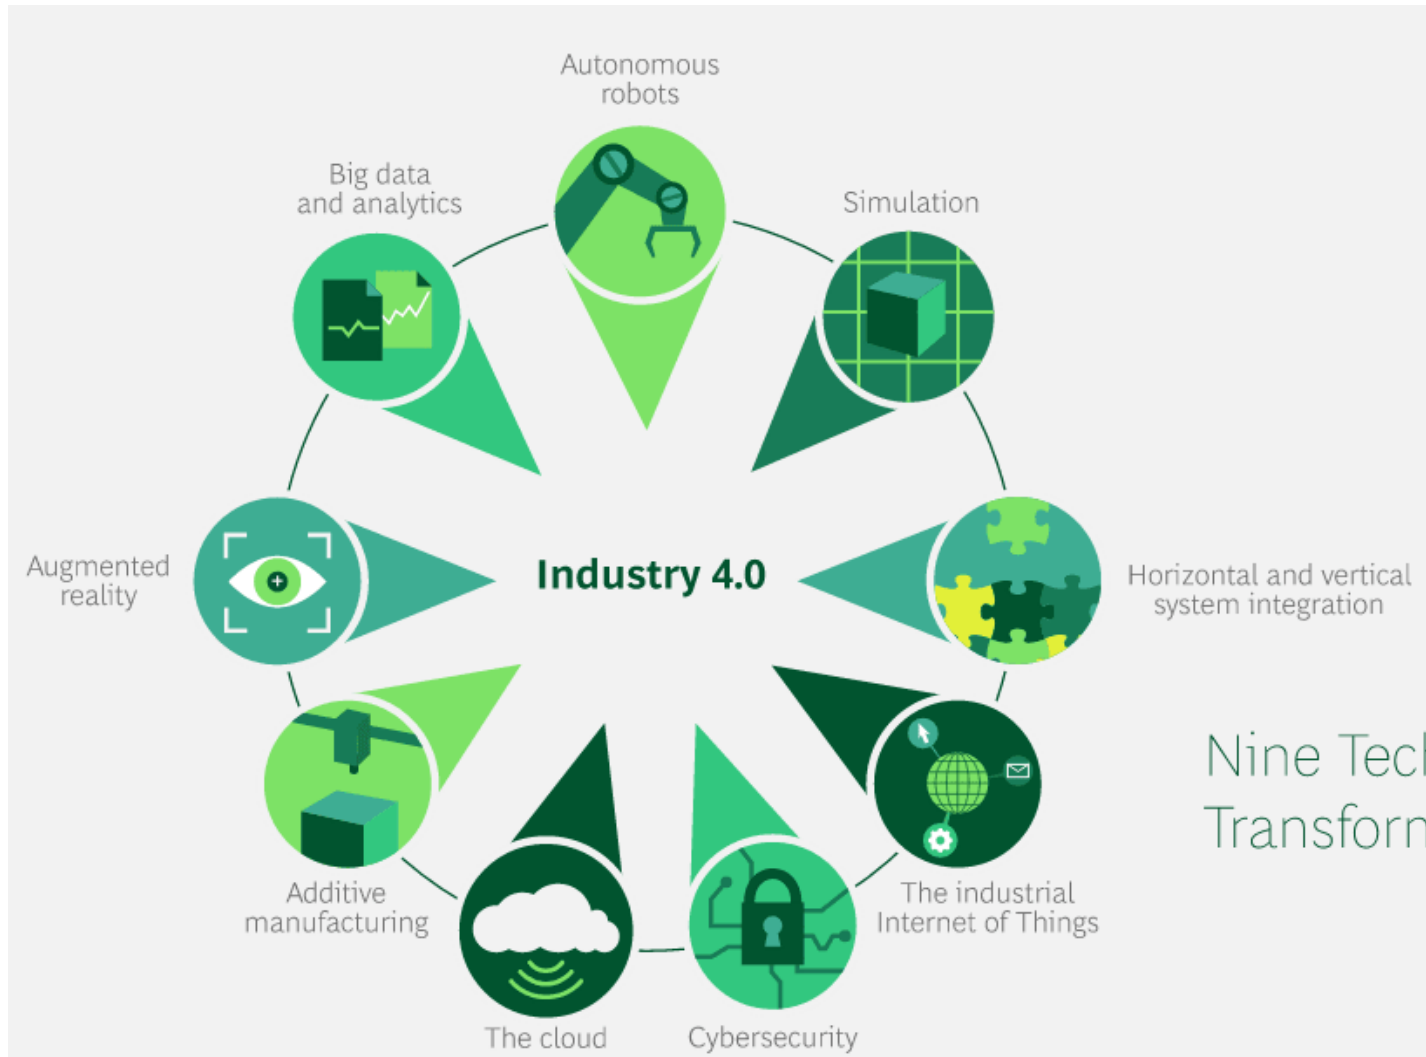

# Industrial 4.0

---

# Industrial 4.0

# What is the real meaning of Industry 4.0

---

## Data, computing, connectivity

Big data (real-time)

Internet of Things

Cloud technology

## Artificial intelligence & AA

Predictive algorithms

Machine learning models

Advanced analytics (with big data)

## Human-machine interaction

Touch and voice based interfaces

Virtual and augmented reality

## Digital-to-physical conversion

3D printing

Advanced robotics, autonomous vehicles

Blockchain (e-ledgers)

# Digitization: Opportunity for a new competitive model

---

## Sensors, big data, cloud

Thousands of sensors per plant sending *real-time* data to cloud

## Artificial intelligence

Real-time optimizers increase plant output by >10% vs. BAT

## Advanced analytics

Predictive scheduling & dispatching of deliveries

## Internet of Things (IoT)

Automated replenishment (vendor-managed inventory)

## Virtual/Augmented Reality

Remotely-guided plant maintenance

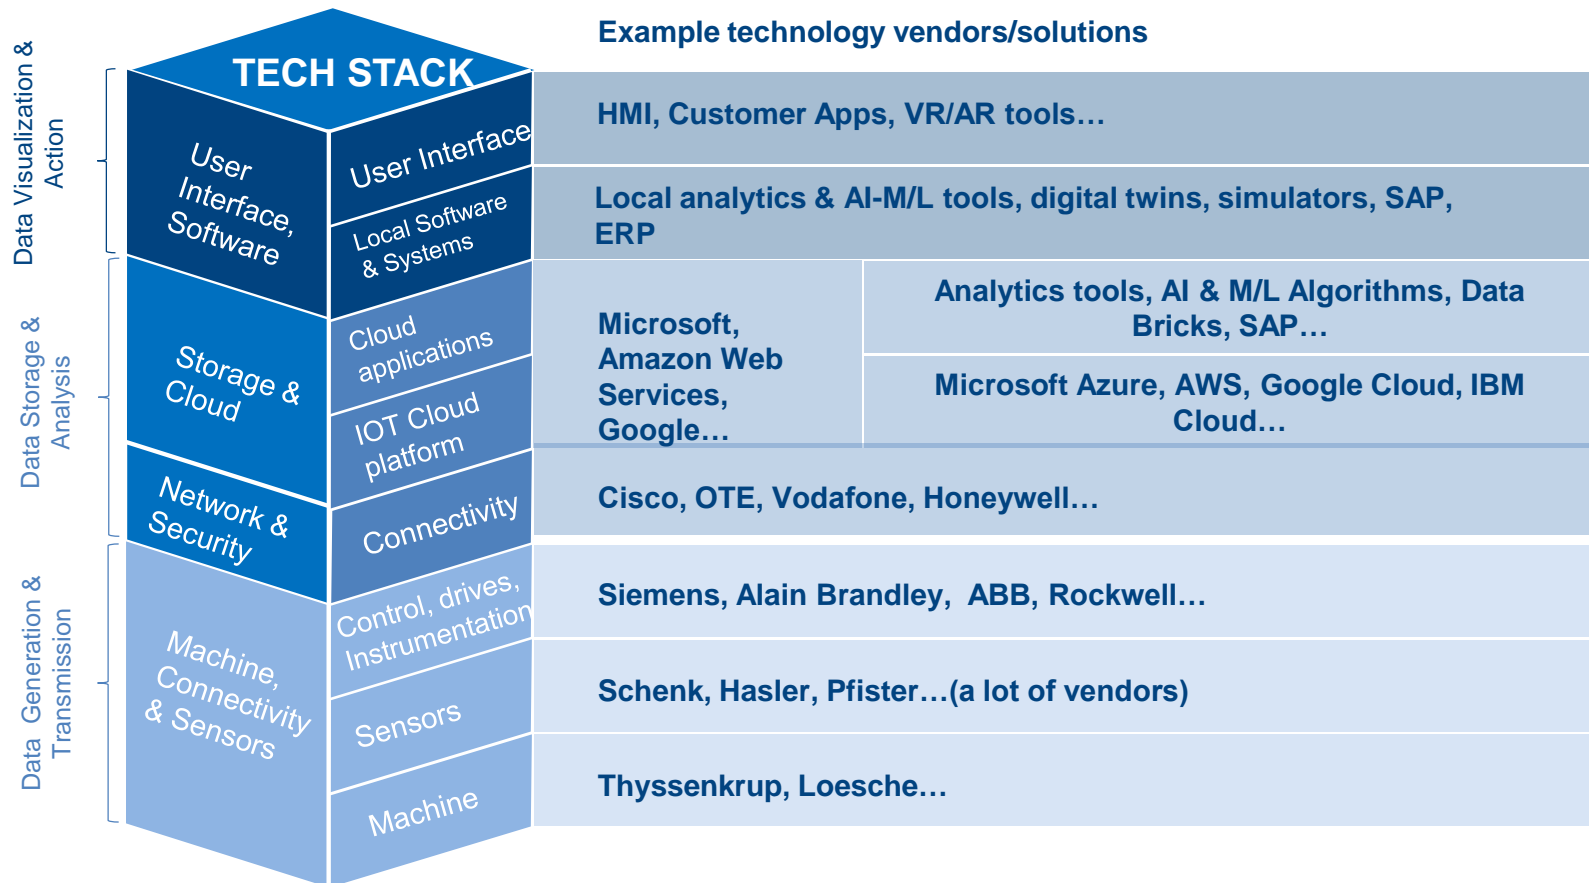

## Digital-to-physical

3D printing of strategic spare parts

# Embedded data platforms

Source: McKinsey, Reuters, thyssenkrup Insights, Mordor Intelligence

# From raw data to smarter business decisions

---

Collect and store data from any source

Add context and organize raw data to make it useful

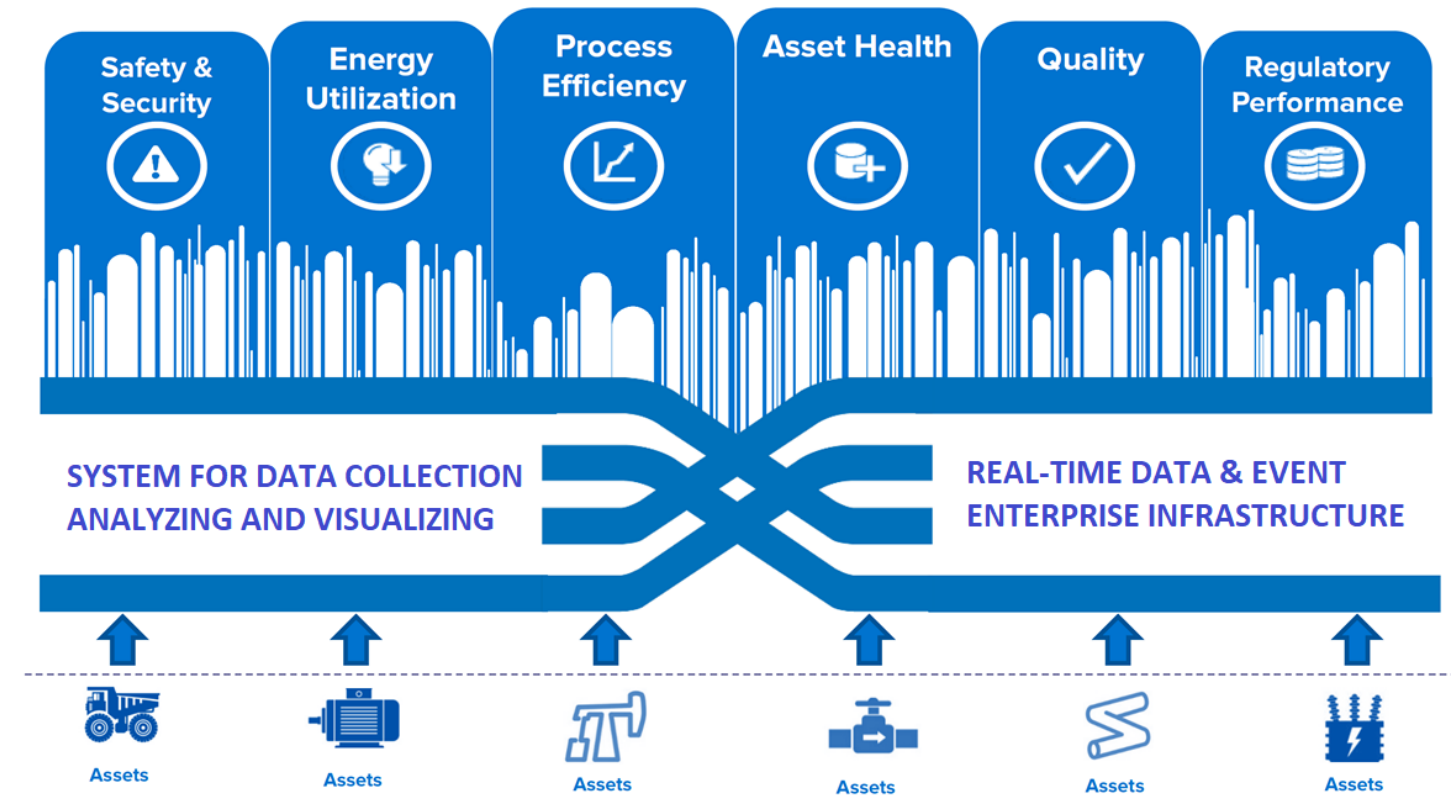

Visualize data on-demand and get custom notifications

Share data between operations and business

✓ **Power data-driven decisions**

# Cybersecurity Model in Infrastructures

# Cyber attacks –Nuclear power plant data

---

Date Reported: Nov 2018

Company: Ingerop

Based: France

Vector: Hack

Type: Exfiltration

Industry: Construction

**Result:**

11,000 files from a dozen projects were accessed.

65 GB data relating to nuclear power plants and other projects

Employee personal data

Cost unreported

# Intelligent Agents & Motivation

---

In the IoT of tomorrow, value between devices and across industries could be uncovered using **Intelligent Agents (IAs)**

that can add **autonomy, context awareness, and intelligence**

appropriate and promising technology forming an alternative to traditional interactions among people and objects

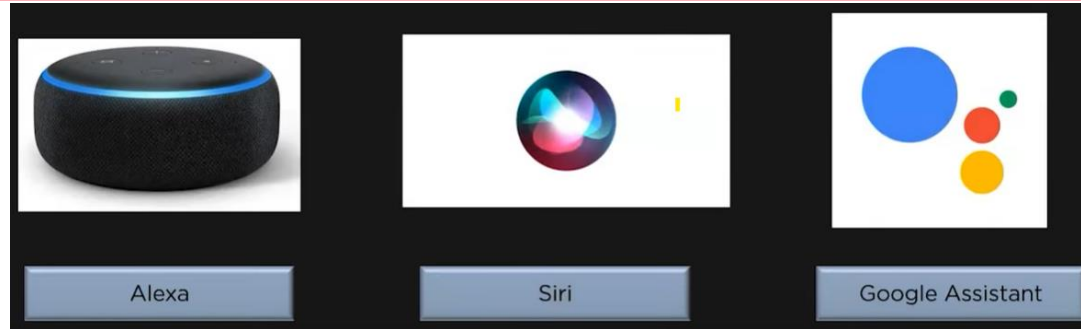

achieve automatic and dynamic behavior, high scalability and self- healing networking, promoting flexibility and trustworthiness

# What are AI Agents?

---

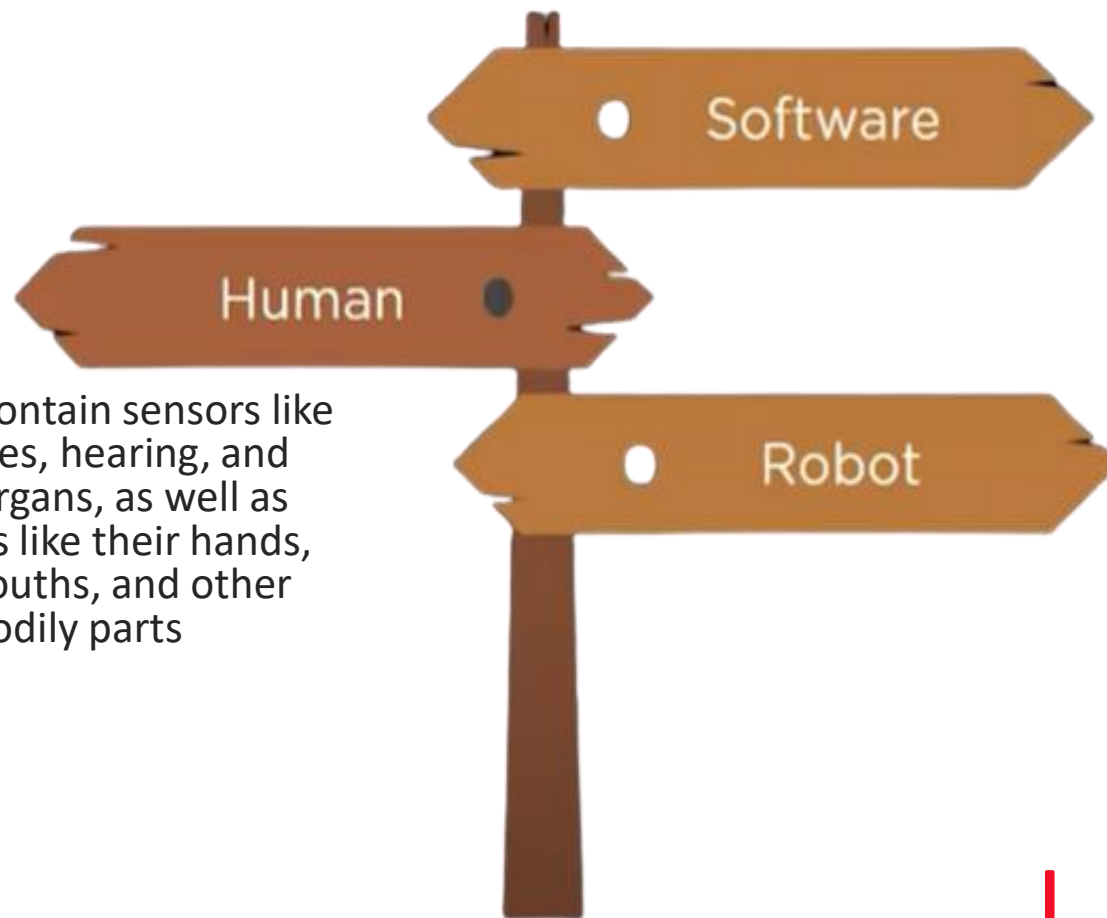

It can be defined as a program that makes decisions and takes action based on the decisions

# Examples of AI Agents

---

This Agent acts on sensory inputs, such as file contents and network packets it has received, by acting on those inputs and with the result on the screen

Humans contain sensors like their eyes, hearing, and other organs, as well as actuators like their hands, legs, mouths, and other bodily parts

These agents feature a variety of high-quality motors that serve as actuators, as well as cameras and infrared range finders that serve as sensors

# Rules for AI Agents

---

## Rule 1

An AI agent needs to have an environmental perception

## Rule 2

Decisions must be based on observations of the environment

## Rule 3

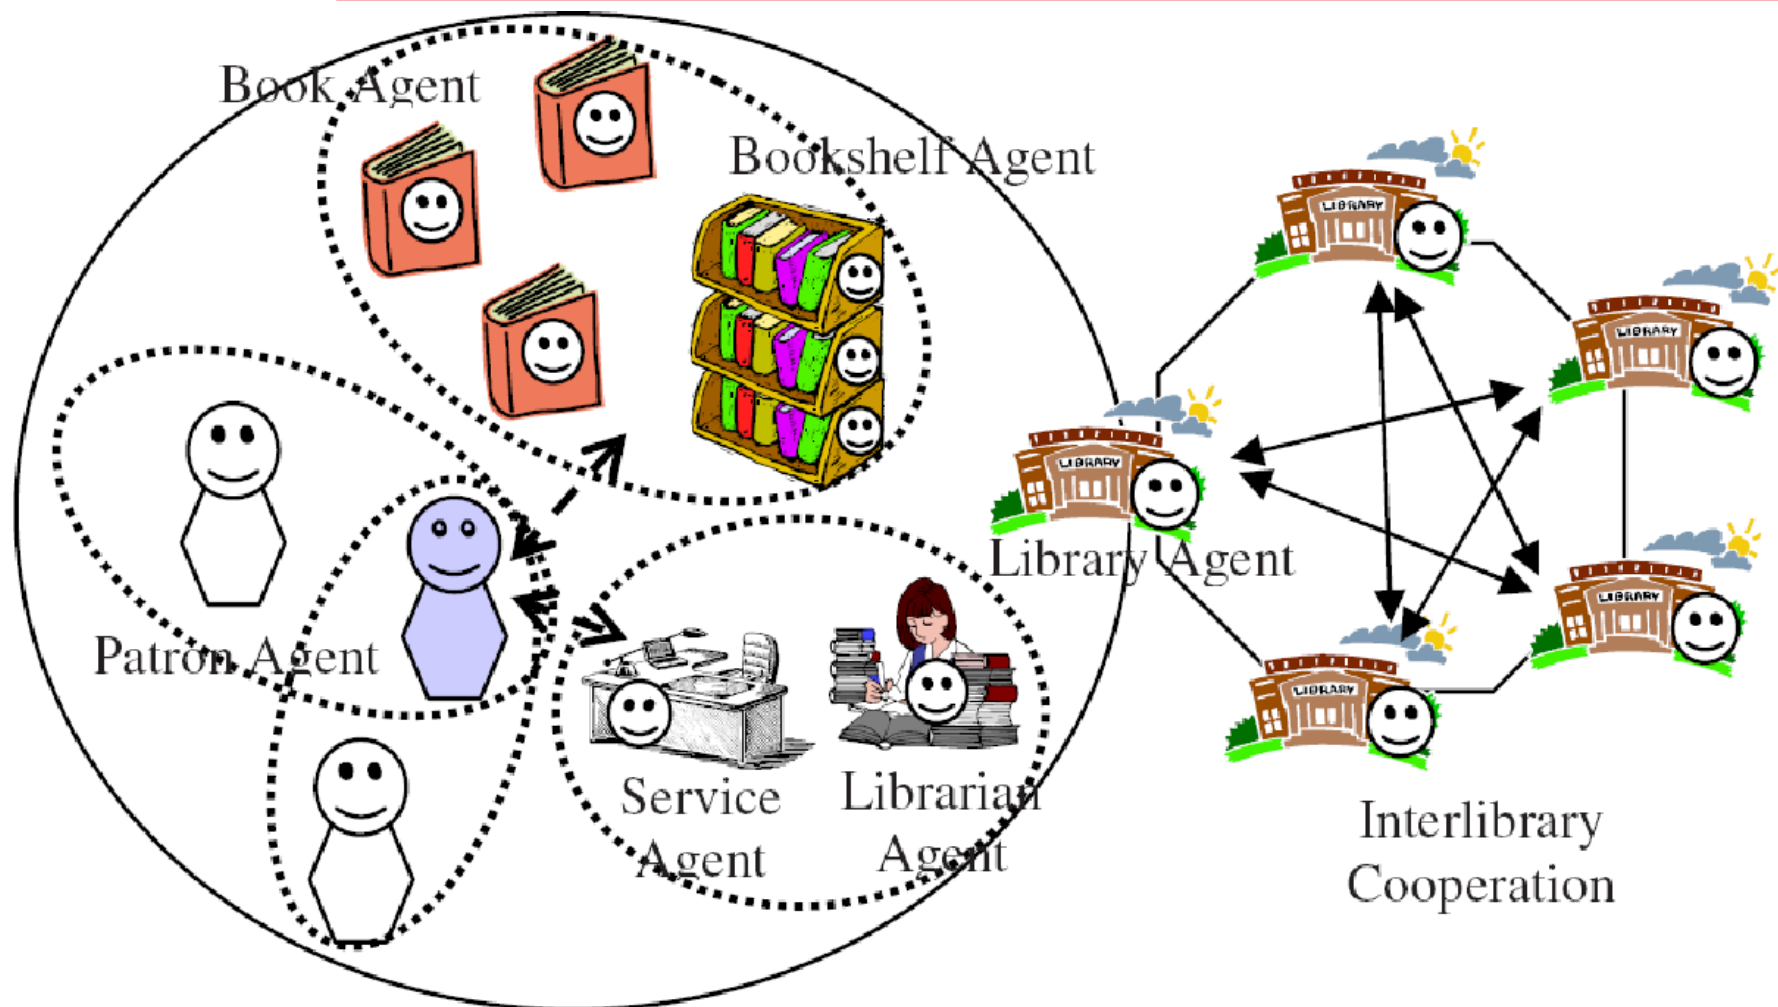

All the actions should be based on decisions

## Rule 4

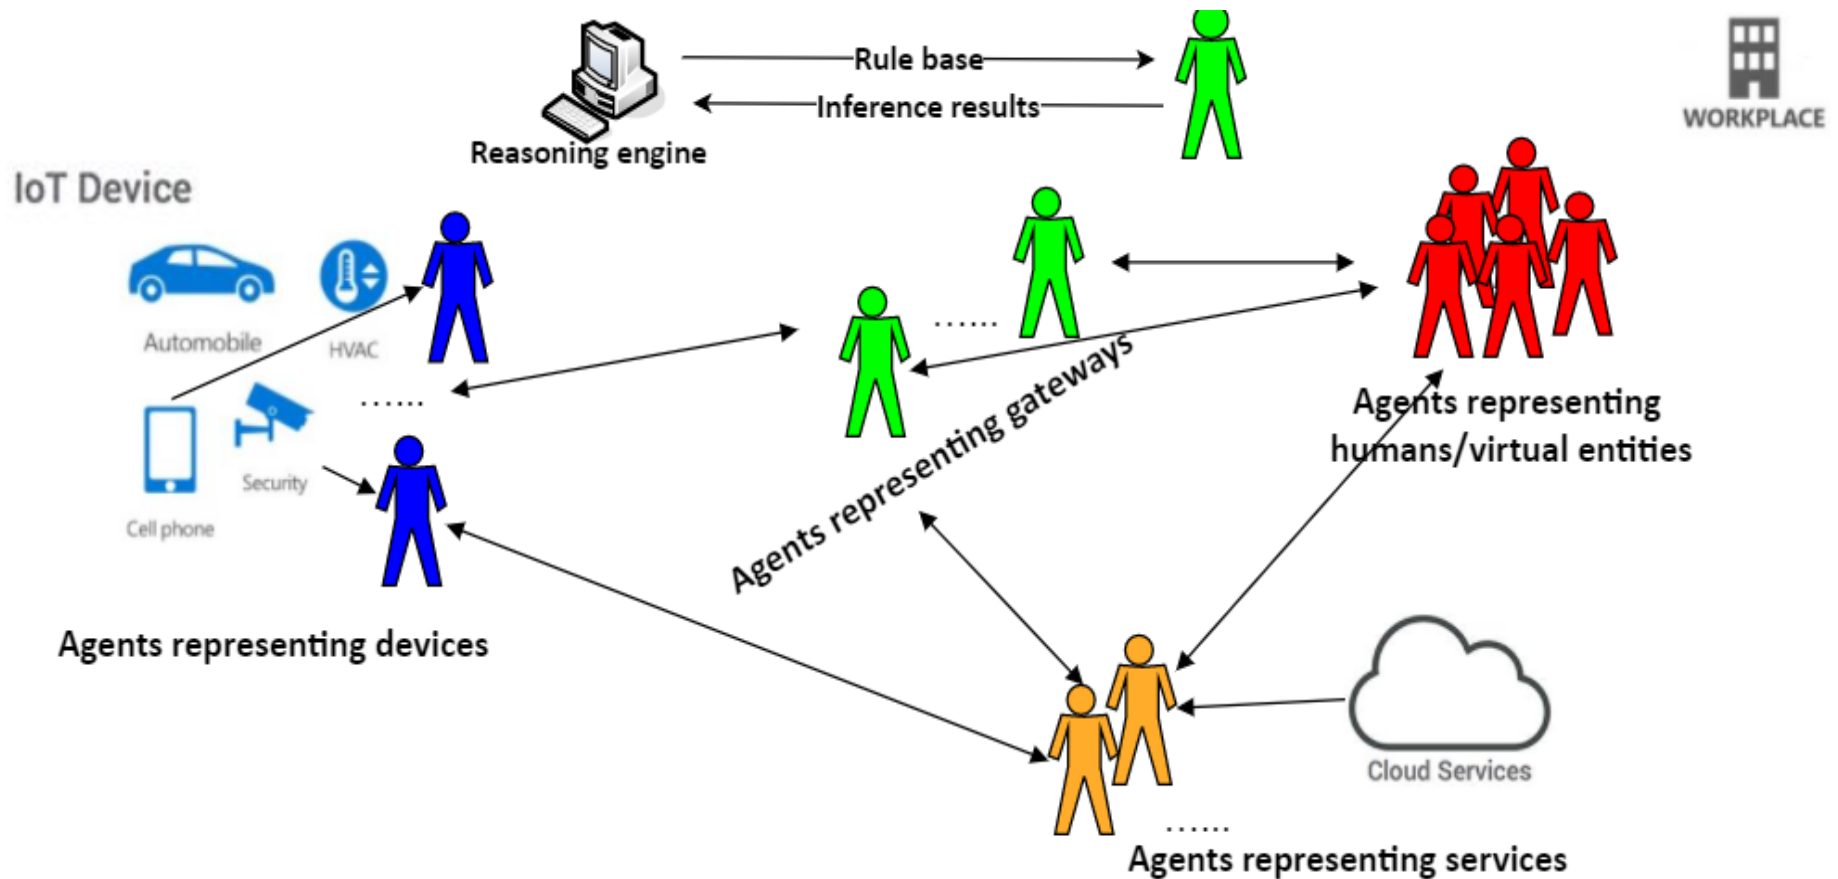

The AI agent's actions have to be logical.

# A library case

# IAs ecosystem

# INBO: AR o VR o AI o IoT

---

## 3 step procedure

1<sup>st</sup>: Study the monument - site

2<sup>nd</sup>: Augment Reality / Virtual Reality (AR/VR)

3<sup>rd</sup>: Artificial Intelligence / Internet of Things (AI/IoT)

**INBO** is a three-stage methodology that included an INDEX and an IT Booklet, (**INDEX** + **BOOKLET** = INBO) which allows both monument monitoring and real-time emergency response.

Ancient City of Philippi

# INDEX

The first phase includes the development of an INDEX for each Monument.

- identify, record, classify and prioritize the dangers that threaten a Monument / site

A **questionnaire** will be shared to site managers and responsible stakeholders

This questionnaire will collect **data related to**

- **natural hazards**, such as hurricanes, lightning, flash floods, landslides etc.,
- **natural-human induced hazards**, such as agro and forest fires,
- **man – made hazards**, such as air, water pollution,
- **technological risks**, such as IT Protection Systems failure.

## QUESTIONNAIRE

### QUESTIONNAIRE

*Behind indicators and reports, there is a daily reality for the numerous Natural or Cultural heritage sites around the globe and the millions of people visiting them or living nearby. What does a number mean and whether it is enough to describe reality is a difficult question to answer. Yet, it is a way to study and approach the magnitude and depth of potential endangerment. This questionnaire was prepared by Dr. Kalliopi Kravari and Prof. Dimitrios Emmanouiloudis<sup>1</sup> in the context of INBO effort. All questions concern your perception and experience of the phenomena and their spread. In addition, certain demographics are required. Please answer the following questions precisely. Kindly be informed that your information is covered by confidentiality. The research and its results are without bias and consequences. Thank you for your time and cooperation.*

**Code:** Choose an item.

*Please mark an x in the box corresponding to the degree of agreement for each question that follows.*

*Please select if you will be involved in the study of Cultural or Natural Heritage Monument:*

Cultural Heritage Monument ☐

Natural Heritage Monument ☐

*Please indicate your affiliation / authority position regarding the Heritage Monument (Name/Surname is optional):*

#### Demographic – Site Data

**A. Monument Name:** [Click here to enter text.](#)

**B. Location**

## INDEX + BOOKLET

---

### 1. **Study the monument** (Ancient City of Philippi)

1a. Characteristics of site e.g. marshlands

2b. Potential types of hazards e.g. flooding

### 2. Reproduce site using **Augment Reality**

2a. Demonstrate risky locations etc

2b. Provide awareness to public/visitors/etc

2c. Provide guidelines e.g. evacuation of site

# INDEX + BOOKLET

## 1. Study the monument

## 2. Reproduce site using **Augment Reality**

## 3. Monitor and manage site using **Internet of Things** & support collaboration and response via **Artificial Intelligence**

3a. IoT Equipment e.g. sensors, etc

3b. Collecting and **reasoning** on data

3c. Smart real time control application

3d. AI techniques for stakeholders

## INDEX (Risk Levels) Smart real time system

- ✓ Hazard Analysis
- ✓ Risk Analysis
- ✓ Preparedness
- ✓ Response
- ✓ Recovery

# INBO Smart real-time system

# Intelligent Agents & INBO System

---

The connecting link of the system is the **intelligent agents** which create a human-like artificial intelligence environment without the need for supervision

# Monitoring and Management

---

## Need for Monitoring and Management

- ✓ **Smart devices** and **applications** from daily life could be used
- ✓ Synergy of **GIS** and **IoT** for **Weather Disasters**
- Data measured and collected by distributed sensors (in different locations)
- The system generates alerts
- Dissemination in near real-time to responsible entities and the public
- Multiple dissemination mechanisms

# Smart World

## meteorological - hydrological hazards

**Natural weather events:** hurricanes, forest fires, floods, volcanoes, tornadoes and earthquakes

- IoT (sensors) monitors natural weather events and notify about critical safety information
- Sensor technology offers real-time information during and after a natural weather event

For example, sensors are capable of monitoring:

- detect increased water levels before a hurricane
- track how quickly a forest fire is spreading

We have to go beyond that

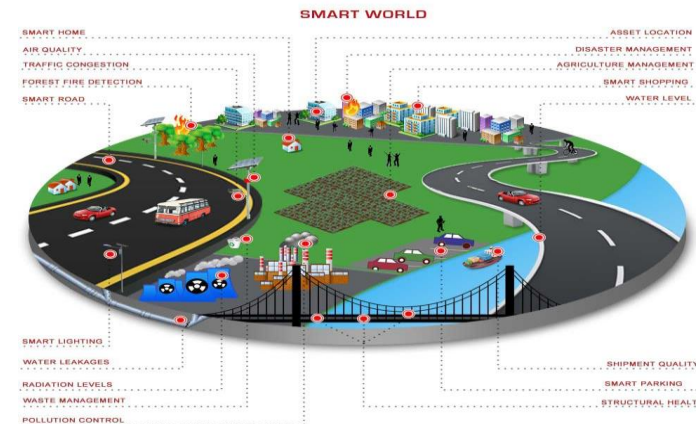

# Smart World

## meteorological - hydrological hazards

predict natural disasters?

Early warning systems:

- ❑ **Risk knowledge:** categorical system of hazard analysis
  - officials prioritize local response efforts and manage their resources (smart automation a step further!)
- ❑ **Monitoring:** hazard identified, up-to-date environmental track changes in order to reflect the severity and expected outcome of the natural disaster
- ❑ **Warning communication:** multi-channel communication protocols
- ❑ **Response capability:** Information alone cannot assure a positive outcome (we need more!)

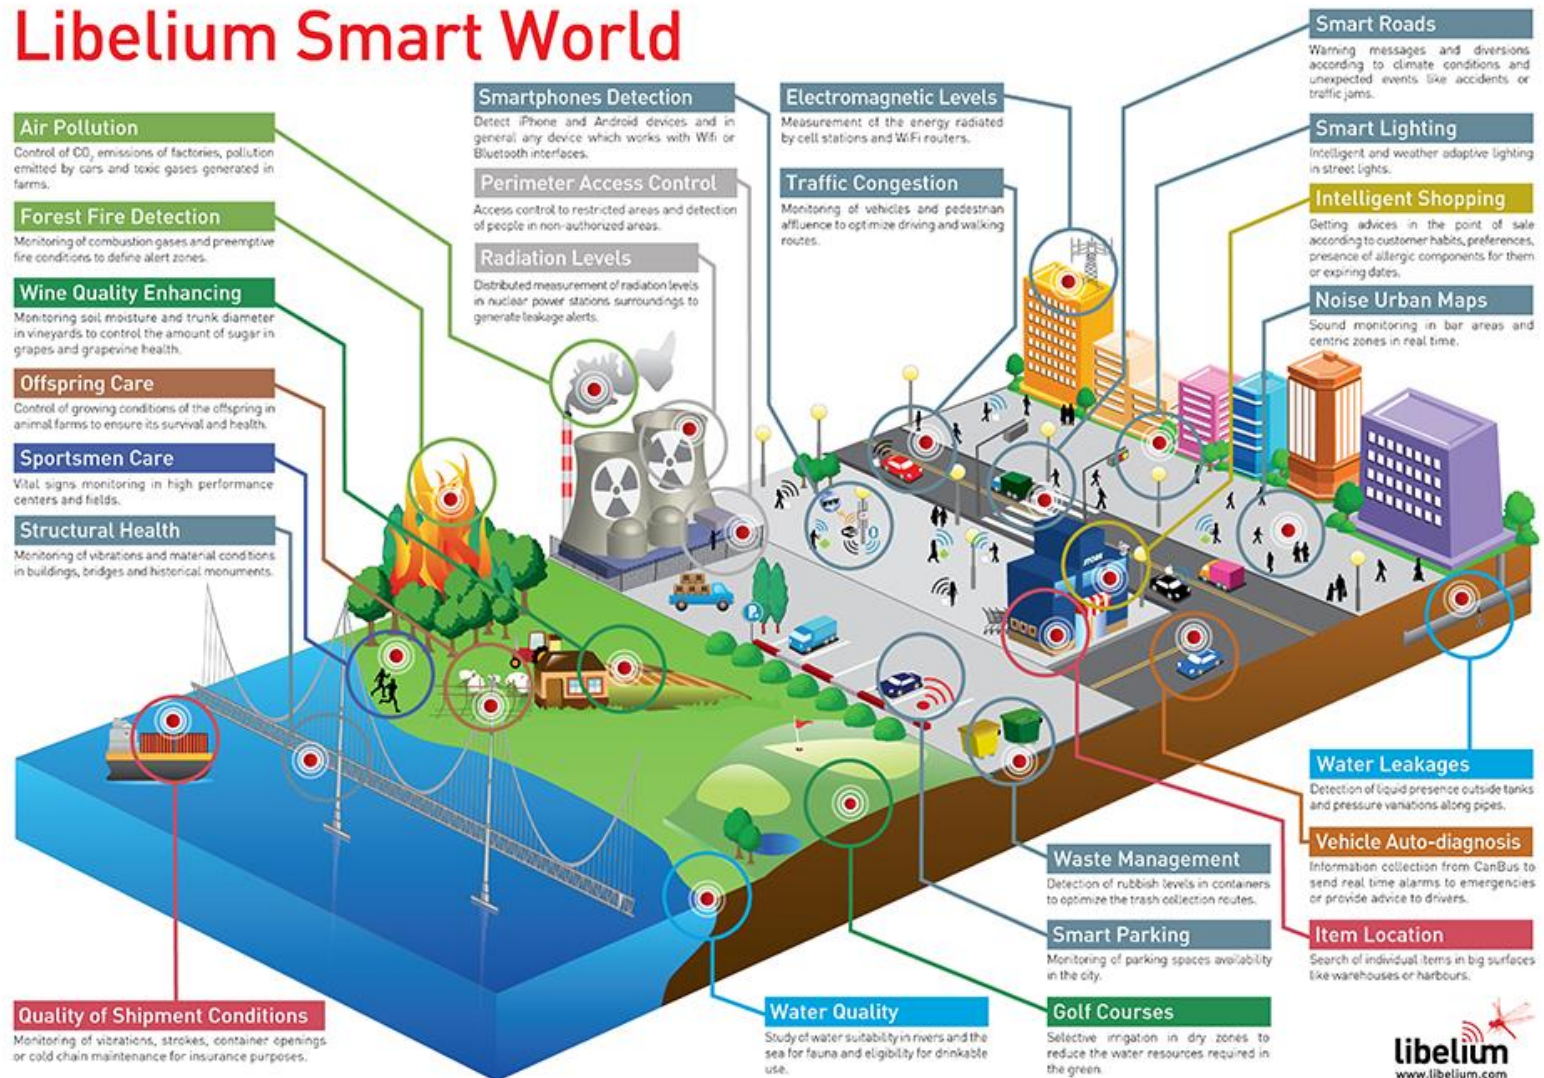

# Smart World

## meteorological - hydrological hazards

### Libelium Smart World

# EPILOGUE

---

From the above presentation, we hope that it can be easily understood the use and the role of New Technologies, especially the ones of Informatics, to the protection of Sites and Monuments especially from Natural and Manmade risks.

We believe that with their help, we could remarkably facilitate and strengthen the purpose of Sites and Monuments protection from tangible risks.

Thus, in this case, Science help us (the Global Community) walking towards the right direction

**Thank you for your  
attention**

---
